

# WHAT TO KNOW Before You Spray Foam

## ENSURE YOUR SAFETY DURING INSTALLATION

While spray foam is a healthy product that improves indoor air quality by reducing air infiltration, there are several steps during the installation process that need to be followed to ensure your family's safety.

- During the application of spray foam, our installers will properly ventilate the area using large commercial fans. No other persons or pets should be in the home during the initial application and for 24 hours after spraying is complete.
- HVAC equipment should be turned off prior to spray foam insulation being installed so that there is no chance of fumes being spread to other areas of the home.

## KNOW YOUR FOAM & CONTRACTOR

Spray Foam products are put through stringent testing procedures to measure the levels of Volatile Organic Compounds after the product has cured. Creative Conservation only uses reputable manufacturers who have products labeled as NO VOC.

While we hope to be your contractor of choice, your ultimate safety is our primary concern. Please only choose qualified spray foam applicators and have them provide you with a copy of their ventilation and safety protocols.

Creative Conservation has over thirty years of experience installing spray foam insulation in a safe and effective manner.
